A world map visualization of life expectancy at birth for 2020 for Uganda, South Africa and the USA

A world map visualization of gross domestic product per capita for 2020 for Uganda, South Africa and the USA

A scatterplot showing the relationship between gross domestic product per capita and life expectancy at birth for 2020 for Uganda, South Africa and the USA.

A description and interpretation of the relationship between gross domestic product per capita and life expectancy at birth for 2020 for Uganda, South Africa and the USA.

From the scatter plot, there is a linear relationship between gross domestic product per capita and life expectancy at birth. As the GDP per capita increases for a country, the life expectancy also improves. This is exemplified from the GDP per capita of Uganda of 2,678.01 ppp$, with a life expectancy at birth of 64.6 years. However, when the GDP per capita increased to 67,342.07 ppp$ as in case of USA, the life expectancy increased to 77.1 years.
